

Product Security

CISO Perspective

Joe Silva

Chief Information Security Officer, JLL

Supply chain-based threat vectors represent the fastest growing and least controlled security risk

Why should you care?

Differentiate your product by focusing on security and creating trust with the customer

Accelerate the procurement process by quickly navigating the customer's security review

Prevent or minimize breach events that impact customer relationships and derail execution

Enable exit by not having to disclose a breach or address security issues in your product

Why do I care?

If you store my data?

If you hold my credentials?

If your product is on my systems or network (IT or OT)?

If your product access my applications (self-hosted or SaaS)?

What should you secure?

Authentication

Network traffic

Code

Infrastructure

My questions?

 **How do you detect and address vulnerabilities in your application, infrastructure, and hardware?**

 **How do you maintain the integrity of your SDLC and software bill of materials?**

 **How do you identify and address misconfigurations in your infrastructure?**

 **How do you prevent, detect, and respond to cyber attacks?**

Discussion
